PREFACE.

EVER ſince the Europeans have made long Voyages, Mathematicians have been employed in endeavouring to diſcover Methods, to enable them to know at all Times their preciſe Place at Sea. The Poſition of any Place on the Globe is known by its Latitude and Longitude. The Latitude of any Place is its Diſtance from the Equator, North or South, and is eaſily known by taking the Altitude of the Sun, or a Star. The Longitude of a Place is its Diſtance from any given Meridian, Eaſt or Weſt, and is diſcovered by ſolving the following Problem: Knowing the Hour at the Ship, to find the Hour at the ſame Time at any Place whoſe Longitude is well known. Since 24 Hours anſwer to 360 Degrees of Longitude, and one Hour to 15 Degrees; if any inſtantaneous Appearance in the Heavens happens one Hour ſooner at one Place than another, the Difference of Longitude of thoſe Places muſt be 15 Degrees; that Place being to the Eaſt where it happens ſooneſt. This Problem being of the greateſt Importance to Navigation, and highly intereſting to every Sailor, it may be not be amiſs to ſhew what Attempts have been made towards the Solution of it in different Ages.

John Werner, of Nuremberg, in his Annotations on the firſt Book of Ptolemy's Geography, printed in 1514, recommends the obſerving the Diſtance between the Moon and ſome Star, in order thence to determine the Longitude. *Peter Apian*, Profeſſor of Mathematics at Ingoldſtadt, in 1524, makes Mention of the ſame Method. *Oronce Finé* of Briançon about 1530 had the ſame Thought. *Gemma Friſius*, Phyſician and Mathematician at Antwerp, ſpeaks of this Method in a Treatiſe which he publiſhed in 1530. *Nonius (Pedro Nunez)* in 1560, was no Stranger to this Method. *Kepler*, in 1600, ſpeaks much in Favour of the Lunar Method. *Philip the Third*, King of *Spain*, in 1598, was the Firſt, who, convinced of the Importance of the Diſcovery of the Longitude, offered a Reward of 1000 Crowns for a Solution of the Problem. This noble Example was followed by the States-general, who offered 10000 Florins. *John Morin*, Doctor of Phyſic and Profeſſor of Mathematics at Paris, induced by theſe Rewards, in 1633 propoſed his Method to *Cardinal Richelieu*, who appointed Commiſſioners to examine it, (amongſt them were five Mathematicians, *Paſcal*, *Mydorge*, *Boulenger*, *Herigone*, and *Beaugrand*) in order to determine whether he deſerved the Rewards that had been offered. They judged his Method incomplete, through the Imperfection of the Lunar Tables. However in 1645 *Cardinal Mazarin* procured for him a Penſion of 2000 Livres, which he very well deſerved. In 1665 the Obſervatory at Greenwich was built by his Majeſty King *Charles* the Second, who was pleaſed to appoint Mr. *Flamſtead* his Aſtronomical Obſerver; expreſly commanding him to apply him-

himſelf *with the utmoſt Care and Diligence to the rectifying the Tables of the Motions of the Heavens, and the Places of the fixed Stars, in order to find out the ſo much deſired Longitude at Sea, for the perfecting the Art of Navigation.* Theſe were the Words of his Commiſſion, and have ſince been repeated to his Succeſſors. By the Aſſiſtance of Mr. *Flamſtead*'s Obſervations, Sir *Iſaac Newton* was enabled to form his curious Theory of the Moon. This incomparable Man ſpared no Part of that Sagacity and Induſtry ſo peculiar to himſelf, in ſettling the Epochs and other Elements of the Lunar Aſtronomy; but ſtill, for want of a more continued and uninterrupted Series of Obſervations of the Moon, than thoſe of Mr. *Flamſtead*, the Difference of Sir *Iſaac*'s Theory from the Heavens would ſometimes amount at leaſt to five Minutes.

Dr. *Halley* employed much Time on this Subject: but not having an Inſtrument perfect enough to take the Diſtances of the Moon from the Sun or a Star at Sea, he applied himſelf to the Appulſes and Occultations of fixed Stars. In the Concluſion of the Paper, N°. 421, of the Philoſophical Tranſactions, containing a Propoſal of a Method for finding out the Longitude at Sea, within a Degree, by Doctor *Edmund Halley*, he adds, "It remains, therefore, to conſider after what Manner "Obſervations of the Moon may be made at Sea with the ſame Degree of Exactneſs "as at Land; but ſince our worthy Vice-Preſident, *John Hadley*, Eſq; to whom we are "highly obliged for his having perfected and brought into common Uſe the reflecting "Teleſcope, has been pleaſed to communicate his moſt ingenious Invention of an "Inſtrument for taking the Angles with great Certainty by Reflection,* it is more "than probable that the ſame may be applied to taking Angles at Sea with the deſired "Accuracy." This Inſtrument has been ſeveral Times tried at Sea, and found to anſwer thoſe Expectations: the beſt Obſervers differing only one Minute in their Obſervations of the Sun's meridian Altitude.† Conſiderable Improvements have lately been made in this Inſtrument by the Aſtronomer Royal and Mr. *Dollond*: the former having obviated the Errors of the Planes of the Mirrors; the latter, for which he has taken out a Patent, having exhibited a new Method of adjuſting the Inſtrument for the back Obſervation with the ſame Eaſe and Certainty as for the fore Obſervation.

The greateſt Reward that was offered for the Diſcovery of the Longitude at Sea, was by an Act of Parliament, paſſed in the Twelfth Year of the Reign of Queen *Anne*, in which Commiſſioners are appointed to receive and examine any Inventions relative to Navigation, and to grant the Rewards ſpecified therein. This Offer induced *Profeſſor Mayer of Gottingen* to make a Set of Lunar Tables more correct than any that were before publiſhed. By the Aſſiſtance of Sir *Iſaac Newton*'s Theory, his own Obſervations, and ſome furniſhed by *Doctor Bradley*, they were rendered ſo complete as not to err above one Minute in the Moon's Place. They were preſented to the *Board of Longitude* in 1755, and afterwards a more complete Set in 1763; in Conſequence of which his Widow was honoured by Parliament with a Reward of three Thouſand Pounds. *Monſieur de la Caille* attempted to introduce the

† See the Appendix to Mayer's Tables publiſhed by the Board of Longitude.

the Lunar Method of diſcovering the Longitude, and propoſed a Plan of Calculations of the Moon's Diſtance from the Sun and fixed Stars, but through the Imperfection of his Inſtruments, his Succeſs was much leſs than that Method was capable of affording. The bringing it into general Uſe was reſerved for Mr. *Maſkelyne* our *Aſtronomer Royal.* When he engaged at the Inſtance of the *Royal Society* to obſerve the Tranſit of Venus in 1761 at St. Helena, both in going and returning he practiſed this Method, and found he could always diſcover the Longitude within a Degree. On his Return from his Voyage, he publiſhed his Journal under the Title of The *Britiſh Mariner's Guide,* in which he ſuggeſted the Plan of a *nautical Ephemeris,* and gave a ſhorter and eaſier Method of correcting the Effects of Refraction and Parallax than any before him. On preſenting his Book to the *Board of Longitude,* the *Commiſſioners* were ſo pleaſed with it, that they adopted his Plan; and in conſequence of it ordered a *nautical Ephemeris* to be calculated, which was firſt publiſhed in 1767, and is now printed in advance for the Uſe of Sailors, the laſt being for 1774. Soon after the firſt Publication, the Rules that were given for correcting the Effects of *Refraction* and *Parallax* in the Appendix being judged difficult for Sailors, it was propoſed to reduce them to Tables. The moſt expeditious and ſafe Method of calculating them was thought to be by Mr. *Lyons's* Rule publiſhed in the *Requiſite Tables,* annexed to the nautical Ephemeris. Accordingly the *Commiſſioners of Longitude* engaged Mr. *Lyons,* Mr. *Parkinſon* Junior, M. A. Fellow of Chriſt College, Cambridge, and Mr. *Williams,* M. A. of the ſame College, to calculate them. Mr. *Williams* aſſiſted as far as 93° of Diſtance. The Remainder was finiſhed by the other two Gentlemen. The Method of calculating was as follows: Every fourth Degree of Diſtance of the Moon from the Sun or a Star, and in the Beginning of the Tables every other Diſtance, were computed by the above Rule. The intermediate Diſtances were got by Interpolation. The Correction ariſing from ſecond Differences, being ſeldom above two or three Seconds, was allowed for.

Having given a ſhort Account of the Lunar Method, it may not be amiſs to hint what has been done in different Ages towards finding the Longitude by *Time-keepers.* *Gemma Friſius* was the firſt who ſuggeſted the Method of finding the Longitude at Sea by Means of ſmall Clocks or Watches. If a Watch that would keep Time at Sea, was ſet to the Time at Greenwich, or any given Place, before the Ship ſet Sail; nothing would be wanting to find the Longitude, but to get a celeſtial Obſervation for the Time at the Ship, and compare the Difference between that and the Time of the Watch. After *Gemma Friſius*, *Metius* and ſome others attempted it, who all failed. The State of Watch-making was at that Time very imperfect, and not accurate enough for ſuch Purpoſes. About 1669, the celebrated *Huygens* attempted the Uſe of Pendulum Watches at Sea, but without Succeſs. The next Perſon who applied his Thoughts this Way, was *Henry Sully,* who left England before 1714, and ſpent ſome Time at Vienna, where he publiſhed a ſmall Treatiſe with the following Title, — Régle artificielle du Tems, par H. S. de Londres, imprimé à Vienne en Aûtriche 1714. Soon after this he quitted Germany for France, where he ſpent the Remainder of his Life chiefly in improving Time-keepers for the

the Diſcovery of the Longitude. What is known of Watch-making in France is principally owing to him. In the Year 1716, he preſented a Watch of his own making to the Academy of Sciences; which was approved, firſt, on Account of the conſiderable Diminution of Friction in it; ſecondly, becauſe what remained of it, was by a ſingular Addreſs made uniform; and thirdly, becauſe the Equality of the Parts of this Watch ſhewed great Sagacity in the Inventor. In 1726 he went to Bourdeaux to try his marine Watches, and whilſt he was engaged in perfecting them, was ſeized with a Diſorder in his Breaſt, which occaſioned his Death in four Days. The famous *Julien le Roy* was his Scholar, and has perfected many of his Inventions in Watch-making.

In 1726, Mr. *John Harriſon*, famous for his Time-keepers, began to apply his Thoughts entirely to the Conſtruction of them. The three firſt Machines he made are now depoſited at the Royal Obſervatory at Greenwich, and likewiſe his Watch, which has been tried in two Voyages at Sea; the firſt in 1761 to Jamaica; the ſecond to Barbadoes in 1764. It did not appear by theſe Trials ſufficiently exact to anſwer what was required by the Act of the Twelfth of Queen *Anne:* and the Trial that has been made of it ſince by the *Aſtronomer Royal*, confirms the Judgment formed of it by the *Commiſſioners of Longitude.*[*] Some other Watches have been made ſince Mr. *Harriſon*'s, one on his, and the others on different Conſtructions; which are now actually on Trial in an Expedition to the South Seas, under the Direction of Captain *Cook* of the *Reſolution Sloop of War*, for the Improvement of Navigation and Geography. His Majeſty, always attentive to the Progreſs of the Sciences, has taken this Expedition under his Protection, and committed the Care of it to the firſt Lord of the Admiralty, from whoſe acknowledged Abilities and Activity the Marine Department has every Thing to expect. The Province of Natural Hiſtory in the preſent Voyage is aſſigned to Mr. *John Reinhold Forſter*, aſſiſted by his Son. In the laſt Expedition our botanical Syſtem was enlarged by Mr. *Banks* and Dr. *Solander*, with 10 or 1200 new Plants, who alſo made conſiderable Additions to other parts of Natural Hiſtory, all which will be communicated to the Public in due Time. It is happy for a Country, when Gentlemen of Mr. *Banks*'s Fortune and Abilities will apply them to the promotion of Science. Our Neighbours the French have ſent out an Expedition under the Command of *M. de Verdun*, to try the two Methods abovementioned of finding the Longitude at Sea. For the honor of our Country let it be obſerved, that of the Sixteen Voyages, ſaid by *M. Bougainville*[†] to have been made round the World, Nine have been performed by Engliſhmen, and Four in the Reign of his preſent Majeſty.

Chriſt College, Cambridge,
Oct. 26, 1772.

A. SHEPHERD, Plumian Prof^{r}. of Aſtronomy,
and Maſter of Mechanics to his Majeſty.

INTRO-

INTRODUCTION.

ALL the heavenly Bodies are raiſed by the Refraction of the Earth's Atmoſphere; the Diſtance therefore of the Moon from a Star for this Cauſe muſt appear leſs than it really is: And as the Moon on the contrary is depreſſed by Parallax, appearing in different Places in the Heavens, when viewed from the Surface, than when ſeen from the center of the Earth, her apparent Diſtance from a Star muſt alſo be conſiderably affected on this Account.

To correct the obſerved Diſtance of theſe two Effects is the Deſign of theſe Tables, and after finding the Moon's Place, was the moſt difficult Proceſs in the Calculation of the Longitude; without the helps of the Nautical Ephemeris and theſe Tables, the Calculations relating to the Longitude could not be performed in leſs than four Hours by the moſt expert in Figures, which now can be done with more Eaſe in half an Hour, and be leſs liable to Errors.

The firſt Column under the name Reduction, contains the joint Effects of Refraction and Parallax, ſuppoſing the horizontal Parallax 53′.

The correcting Logarithm in the ſecond Column is the parallactic Logarithm of the change in the Effect of Parallax by increaſing the horizontal Parallax 9′. Theſe Logarithms are made in imitation of logiſtic and proportional Logarithms. The parallactic Logarithm of 9′ or 540″ = 0, and the parallactic Logarithm of any Arc A = Logarithm 540 — Logarithm of the Number of Seconds contained in A.

The Tables of Refraction are conſtructed for a mean State of the Atmoſphere, when the Barometer is at 30 Inches, and Fahrenheit's Thermometer at 55°.

The third Column, intitled Variation, is the change in Refraction, ariſing from a Variation of 20° of Fahrenheit's Thermometer, or $1\frac{1}{2}$ Inch in the Barometer.

PRECEPTS, *for the Uſe of the Tables.*

I. Enter the Tables with the Degree of Diſtance at Top, and the Degrees of the Moon's and Star's Altitudes on the Side (neglecting the odd Minutes, of which Account will be had afterwards) and take out the Reduction and correcting Logarithm, with their proper Signs. The Aſteriſcs placed for Convenience in the Column of Variation, ſignify that the correcting Logarithms before them in that Altitude of the Moon, are + or Affirmative, and thoſe after them, — or Negative. When there is a Line in the Column of correcting Logarithms, the change ariſing from the Moon's horizontal Parallax being greater than 53′, is nothing.

The Sign + prefixed to any Quantity ſignifies that it is to be added; the Sign — that it is to be ſubtracted.

II. With the ſame Degree of Diſtance, and the ſame Degree of Moon's Altitude, but with the Star's Altitude increaſed by one Degree, find again the Reduction and correcting Logarithm. Take the difference of this Reduction and that found before, and prefix + or — to it, according as the Reduction, conſidered ſimply without its Sign, is increaſed or diminiſhed by the Increaſe of the Star's Altitude; and this will be the change of Reduction for one Degree's Increaſe of the Star's Altitude.

In like manner take the difference of this correcting Logarithm, and that found before, and prefix + or — to it, according as the correcting Logarithm is increaſed or diminiſhed by the Increaſe of the Star's Altitude; and this will be the change of the correcting Logarithm for one Degree's Increaſe of the Star's Altitude.

III. With the ſame Degree of Diſtance, and the ſame Degree of Star's Altitude, but with the Moon's Altitude increaſed by one Degree, find the Reduction and correcting Logarithm, and taking the Difference of them, and the Reduction and correcting Logarithm found at firſt, find in the ſame Manner as has been juſt now explained, the changes of Reduction and correcting Logarithm for one Degree's Increaſe of the Moon's Altitude.

IV. With the ſame Degrees of the Moon's and Star's Altitude as at firſt, but with the Diſtance increaſed by one Degree, find the Reduction and correcting Logarithm, and taking the Difference of them, and the Reduction and correcting Logarithm found at firſt, find the Changes of Reduction and correcting Logarithm for one Degree's Increaſe of the Diſtance.

V. Then ſay, If 60′ give ſuch a change in the Reduction, what will the odd Minutes of Altitude of Star, or Altitude of Moon, or Diſtance give?

Let theſe three propostional Parts be applied according to their Signs to the firſt Reduction, taken ſimply without its Sign, and to the Reſult let the Sign of the Reduction in the Tables be prefixed; and this will be the Reduction required.

In like manner ſay, If 60′ give ſuch a change in the correcting Logarithm, what will the odd Minutes of Altitude of Star, or Altitude of the Moon, or Diſtance give?

Theſe three proportional Parts applied, according to their Signs, to the firſt correcting Logarithm, taken ſimply without its Sign, will give the correcting Logarithm required.

To the correcting Logarithm ſo found, add the parallactic Logarithm of the Exceſs of the Moon's horizontal Parallax above 53′, the Sum is the parallactic Logarithm of an Arc, being the Correction of Reduction, to which prefix + or —, according as the Sign of the correcting Logarithm was + or — in the Tables.

VI. If the Reduction and Correction of Reduction have the ſame Sign (which will moſt commonly be the Caſe) take their Sum and prefix the common Sign to it; but if they have different Signs, take their Difference and prefix the Sign of the greater to it: the Sum, or Difference, with the proper Sign ſo found, will be the Correction of the obſerved Diſtance; which being applied according to its Sign to the obſerved Diſtance, will give the true Diſtance cleared of Refraction and Parallax.

VII. But when the Numbers fall at the Aſteriſcs, where the correcting Logarithms change their Sign, ſeek the Arcs anſwering to the correcting Logarithms taken out of the Table, in the Table of parallactic Logarithms,[*] and Proportion for them, inſtead of the Logarithms themſelves, and you will find an Arc, whoſe Sign muſt be carefully noted, (ſee the two following Precepts) whoſe parallactic Logarithm will be the correcting Logarithm, which therefore (according to Precept 5th) added to the parallactic Logarithm of the Exceſs of the Moon's horizontal Parallax above 53′, will be the parallactic Logarithm of the Correction of Reduction, having the ſame Sign with the Arc found above.

VIII. In theſe Directions it has been ſuppoſed, that the Sign of the Reduction and correcting Logarithm in the Table, continue the ſame when the Altitudes of the Moon and Star and Diſtance are increaſed by one Degree; which indeed will be the Caſe ſixty nine Times out of ſeventy. However, if the Caſe ſhould happen, that the Sign of the firſt Reduction, and the Sign of any of the three ſucceeding Reductions taken out of the Table ſhould be different, then you have nothing to do, but, inſtead of the Difference of the firſt Reduction, and the Reduction in Queſtion, to take their Sum, and prefix the Sign — to it; and this will be the change of Reduction for one Degree's

Increaſe

---

[*] The Minute is marked at the top of the Table, and the Seconds in the firſt Column on the left Hand

Increaſe of the Star's or Moon's Altitude, or the Diſtance, to be made Uſe of as before. And ſhould the correcting Logarithm change its Sign, find the Arc anſwering to the correcting Logarithms in the Table of parallactic Logarithms, whoſe Signs will be the ſame as of the Logarithms themſelves, and Proportion for them in the very ſame Manner as for the Reduction, and as to the reſt proceed according to Precept the 7th.

IX. If when the three proportional Parts have been applied to the firſt Reduction, taken ſimply without its Sign, the Reſult is Negative (whether in the caſe of Precept the 8th, or otherwiſe) the Reduction required will, inſtead of the ſame Sign, have a contrary Sign, to that of Reduction the firſt found in the Table. The ſame may be ſaid with reſpect to the Arc correſponding to the correcting Logarithm, whoſe Sign determines that of the Correction of Reduction found from it.

EXAMPLE I.

Let the obſerved Diſtance be 38° 22′ 17″, the Moon's Altitude 20° 9′, the Star's Altitude 12° 27′, and the Moon's horizontal Parallax 57′ 24″. In the general Table with Diſtance 38°, Altitude of the Moon 20°, and Altitude of the Star 12°, I find in the Column of Reduction 6′+51″, and correcting Logarithm 920, which muſt be + becauſe it is above the Aſteriſc. Then with Diſtance 38°, the Moon's Altitude 20°, and Star's Altitude 13°, I find the Reduction 5′+18″; and correcting Logarithm + 1033, the Difference of 6′ 51″ and 5′ 18″ is 1′ 33″, which with the Sign — prefixed to it, becauſe the Reduction is leſſened by the Increaſe of the Star's Altitude, is the change in the Reduction for one Degree's Increaſe of the Star's Altitude. The Difference of 920 and 1033 is 113, which, becauſe the correcting Logarithm is increaſed by the Increaſe of the Star's Altitude, gives + 113 the change of the correcting Logarithm for one Degree's Increaſe of the Star's Altitude.

In the ſame manner with Diſtance 38°, Moon's Altitude 21°, and the Star's Altitude 12°, I find the Reduction 8′+4″, and correcting Logarithm + 851, the Difference of 6′ 51″ and 8′ 4″ gives + 1′ 13″, the change in the Reduction for one Degree's Increaſe of the Moon's Altitude, and the Difference of 920 and 851, gives — 69, the change in the correcting Logarithm for one Degree's Increaſe of the Moon's Altitude.

Again, with Diſtance 39°, Moon's Altitude 20°, and Star's Altitude 12°, I find the Reduction 6′+25″, and correcting Logarithm + 962, the Differences of 6′ 51″ and 6′ 25″, and 920 and 962 being taken, give — 26″ and + 42, the changes in the Reduction and correcting Logarithm for one Degree's Increaſe of Diſtance.

Therefore the change in the Reduction for

$$60' \text{ Increaſe of} \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}1'-33''\\ 1+13\\ -26\end{array}\right\} \begin{array}{c}\text{and}\\ \text{for}\end{array} \left\{\begin{array}{r}27'\\ 9'\\ 22\end{array}\right\} \begin{array}{c}\text{the odd Mi-}\\ \text{nutes of}\end{array} \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{it is} \left\{\begin{array}{r}-42''\\ +11\\ -\ 9\end{array}\right.$$

The Sum of theſe three proportional Parts with their proper Signs is — 40″
which therefore ſubſtracted from the firſt found Reduction — 6′ 51″

gives the true Reduction — — — + 6 11, with the Sign +
becauſe the Reduction in the Tables was ſo.

The change in the correcting Logarithm for

$$60' \text{ of} \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}+113\\ -\ 69\\ +\ 42\end{array}\right\} \text{and for} \left\{\begin{array}{r}27'\\ 9'\\ 22\end{array}\right\} \text{it is} \left\{\begin{array}{r}+51\\ -10\\ +15\end{array}\right\}$$

The Sum of theſe three proportional Parts, with their proper Signs, is + 56
which added to the firſt found correcting Logarithm — 920

gives the true correcting Logarithm — — + 976, with the Sign +, as in the Tables.

The Moon's horizontal Parallax being 57′ 24″, the Exceſs above 53′ 0″ (the Parallax to which the Reductions are calculated) will be 4′ 24″, to
the parallactic Logarithm of which — 311
adding the correcting Logarithm juſt now found 976
gives — — — + 1287

The Sum is the parallactic Logarithm of + 28″, which has the ſame Sign as the correcting Logarithm, and adding it to — + 6′ 11″, the true Reduction,
the Sum — — — + 6′ 39″ is the Correction of Diſtance, which applied
to the obſerved Diſtance — 38° 22′ 17″
gives 38° 28′ 56″ the true Diſtance cleared of the Effects of Refraction and Parallax.

EXAMPLE II.

Let the obſerved Diſtance be 45° 40′ 14″, the Moon's Altitude 21° 26′, the Star's Altitude 15° 54′, and the horizontal Parallax 56′ 30″.

Then in the general Table to Diſtance 45°, and Altitude of Moon 21°, and Star's Altitude 15°, I find the Reduction 0′ + 56″, and correcting Logarithm + 2130; but as one Degree of change in the Star's Altitude changes the Sign of the correcting Logarithm, I find what Arc anſwers to the parallactic Logarithm + 2130, which will be + 4″. In the ſame manner for

$$\left.\begin{array}{lr}\text{Diſtance} & 45^\circ \\ \text{Moon's Alt.} & 21 \\ \text{Star's Alt.} & 16\end{array}\right\} \begin{array}{lr}\text{Reduction is} & 0'-23'' \\ \text{correct. Logarithm} & -1778 \\ \text{correſponding Arc} & -9''\end{array}$$

$$\left.\begin{array}{lr}\text{Diſtance} & 45^\circ \\ \text{Moon's Alt.} & 22 \\ \text{Star's Alt.} & 15\end{array}\right\} \begin{array}{lr}\text{Reduction} & 1'+50'' \\ \text{correct. Logarithm} & +1618 \\ \text{correſponding Arc} & +13''\end{array}$$

$$\left.\begin{array}{lr}\text{Diſtance} & 46^\circ \\ \text{Moon's Alt.} & 21 \\ \text{Star's Alt.} & 15\end{array}\right\} \begin{array}{lr}\text{Reduction} & 0'+37'' \\ \text{correct. Logarithm} & +2732 \\ \text{correſponding Arc} & +1''\end{array}$$

Therefore the change in Reduction for

$$60' \text{ of} \left\{\begin{array}{l}\text{Star's Alt.} \\ \text{Moon's Alt.} \\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}1'-19'' \\ +54 \\ -19\end{array}\right\} \text{and for} \left\{\begin{array}{c}54' \\ 26 \\ 40\end{array}\right\} \text{it is} \left\{\begin{array}{r}-1'\ 11'' \\ +23 \\ -12\end{array}\right.$$

Sum of the three proportional Parts — — — 1′ 0″
the Difference of this and the firſt Reduction — 0 56
is — — — — — 0 4, therefore, becauſe the Sign of the firſt Reduction is +, the true Reduction is — 0′ 4″, by Precept the 9th.

The change in the Arcs correſponding to the correcting Logarithms for

$$60' \text{ of} \left\{\begin{array}{l}\text{Star's Alt.} \\ \text{Moon's Alt.} \\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}-13'' \\ +\ 9 \\ -\ 3\end{array}\right\} \text{and for} \left\{\begin{array}{c}54' \\ 26 \\ 40\end{array}\right\} \text{it is} \left\{\begin{array}{r}-12'' \\ +\ 4 \\ -\ 2\end{array}\right.$$

Sum of the three proportional Parts — — — 10, the Difference of this and the Arc correſponding to the firſt correcting Logarithm 2130. + 4, (becauſe the Sign of the firſt correcting Logarithm is +) — is — 6, which is the true Arc for the correcting Logarithm, by Precept the 9th, and its parallactic Logarithm — 1954, is the true correcting Logarithm.

The

The exceſs of the horizontal Parallax 56′ 30″, above 53′ 0″, is 3′ 30″, its parallactic Logarithm —— —— 301
added to the correcting Logarithm 1954

gives —2255
the Arc anſwering to which is —3″
the true Reduction —— —4

the Correction of Diſtance —7
obſerved Diſtance —— 45° 40′ 14″

45 40 7, true Diſtance cleared of Refraction and Parallax.

EXAMPLE III.

Let the obſerved Diſtance be 65° 27′ 30″ The horizontal Parallax of the Moon 60′ 25″
Altitude of the Moon 15 21
—————— Star 78 18

In the general Table I find for

Diſtance	Moon's Alt.	Star's Alt.	Reduction	corr. Logarithm
65°	15	78	—47′ 30″	—19
65°	15	79	—47′ 41″	—17
65°	16	78	—47′ 19″	—22
66°	15	78	—47′ 21″	—20

The change in the Reduction for

$$60' \text{ Increaſe of} \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}+11''\\ -11\\ -9\end{array}\right\} \text{and for} \left\{\begin{array}{l}18'\\ 21\\ 27\tfrac{1}{2}\end{array}\right\} \text{it is} \left\{\begin{array}{r}+3''\\ -4\\ -4\end{array}\right.$$

—5
47 30

The true Reduction —47 25

The change in the correcting Logarithm for

$$60' \text{ of} \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}-2\\ +3\\ +1\end{array}\right\} \text{and for} \left\{\begin{array}{l}18'\\ 21\\ 27\tfrac{1}{2}\end{array}\right\} \text{it is} \left\{\begin{array}{r}-1\\ +1\\ 0\end{array}\right.$$

Sum - - - - 0
19

Cor. Log. - - - 19
Exceſs above 53′ - - - 7′ 25″ its parallactic Log. 84

—103, the Parallactic Logarithm of —7′ 6″, with the ſame Sign as in the Tables.

True Reduction - - - - - —47′ 25″
Correction of Reduction - - — 7 6

Correction of Diſtance - - —54 31
Obſerved Diſtance - - - 65 27 30

64° 32′ 59, true Diſtance cleared of Refraction and Parallax.

EXAMPLE IV.

Let the obſerved Diſtance be 49° 17′ 21″ The horizontal Parallax of the Moon 58′ 50″
Altitude of the Moon 43 20
———— Star 27 15

In the geneıal Table I find for

Diſtance	49°	Reduction	+ 0′ 49″	Diſtance	49°	Reduction	— 0′ 18″
Moon's Alt.	43	corr. Logarithm	— 2732	Moon's Alt.	43	corr. Logarithm	— 1653
Star's Alt.	27	correſponding Arc	— 1″	Star's Alt.	28	correſponding Arc	— 12
Diſtance	49°	Reduction	+ 1′ 24″	Diſtance	50°	Reduction	+ 0′ 15″
Moon's Alt.	44	corr. Logarithm	+ 2033	Moon's Alt.	43	corr. Logarithm	— 1954
Star's Alt.	27	correſponding Arc	+ 5″	Star's Alt.	27	correſponding Arc	— 6″

Therefore the change in the Reduction for

$$60' \text{ of } \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{ is } \left\{\begin{array}{r}-67''\\ +35\\ -34\end{array}\right\} \text{ and for } \left\{\begin{array}{c}15'\\ 20\\ 17\end{array}\right\} \text{ it is } \left\{\begin{array}{r}-17''\\ +12\\ -9\end{array}\right.$$

Sum of the three proportional Parts — — — 14
this ſubſtracted from the firſt Reduction — — 49

gives — — — — + 35, the true Reduction.

The change in the Arcs correſponding to the correcting Logarithms for

$$60' \text{ of } \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{ is } \left\{\begin{array}{r}+11''\\ -6\\ +5\end{array}\right\} \text{ and for } \left\{\begin{array}{c}15'\\ 20\\ 17\end{array}\right\} \text{ it is } \left\{\begin{array}{r}+3''\\ -2\\ +1\end{array}\right.$$

Sum of the three proportional Parts — — + 2, which added to the Arc
correſponding to the firſt correcting Logarithm — 1

gives — — — — — 3, which is the true Arc for the correcting Logarithm, and its parallactic Logarithm — 2255 is the true correcting Logarithm with the Sign —, becauſe the Sign of the firſt correcting Logarithm is ſo.

The Exceſs of the horizontal Parallax above 53′ is 5′ 50″, its parallactic Logarithm 188
added to the correcting Logarithm — — — — 2255

gives — — — — — — 2443
The Arc anſwering to which is — 2″ the Correction of Reduction
this ſubſtracted from the true Reduction + 35

gives — — — + 33 the Correction of Diſtance
obſerved Diſtance — 49° 17′ 21″

49 17 54 true Diſtance cleared of Refraction and Parallax.

EXAMPLE V.

Let the obſerved Diſtance be 35° 29′ 45″ The horizontal Parallax of the Moon 56′ 24″
Altitude of the Moon 20 34
——————— Star 17 40

In the general Table I find for

Diſtance	35°	Reduction	+ 0′ 6″	Diſtance	35°	Reduction	— 1′ 28″
Moon's Alt.	20	corr. Logarithm	+ ——	Moon's Alt.	20	corr. Logarithm	— 1528
Star's Alt.	17	correſponding Arc	+ 0″	Star's Alt.	18	correſponding Arc	— 16″
Diſtance	35°	Reduction	+ 1′ 21″	Diſtance	36°	Reduction	— 0′ 11″
Moon's Alt.	21	corr. Logarithm	+ 1653	Moon's Alt.	20	corr. Logarithm	— 2255
Star's Alt.	17	correſponding Arc	+ 12″	Star's Alt.	17	correſponding Arc	— 3″

Therefore the change in Reduction for

$$60' \text{ of} \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}1'-34''\\ 1+15\\ -17\end{array}\right\} \text{and for} \left\{\begin{array}{c}40'\\ 34\\ 30\end{array}\right\} \text{it is} \left\{\begin{array}{r}-63''\\ +43\\ -9\end{array}\right.$$

Sum of the three proportional Parts —— —— — 29, the Difference of
this and the firſt Reduction —— —— + 6

is —— —— —— —— —— — 23, the true Reduction with the Sign —, becauſe 29 is greater than 6.

The change in the Arcs for the correcting Logarithms for

$$60' \text{ of} \left\{\begin{array}{l}\text{Star's Alt.}\\ \text{Moon's Alt.}\\ \text{Diſtance}\end{array}\right\} \text{is} \left\{\begin{array}{r}-16''\\ +12\\ -3\end{array}\right\} \text{and for} \left\{\begin{array}{c}40'\\ 34\\ 30\end{array}\right\} \text{it is} \left\{\begin{array}{r}-11''\\ +7\\ -1\end{array}\right.$$

Sum of the three proportional Parts —— —— — 5, the Difference of this
and the firſt Arc for the correcting Logarithm —— 0

is —— —— —— —— — 5 the true Arc for the correcting Logarithm, which will therefore be — 2033, and adding it to the parallactic Logarithm of (3′ 24″) the Exceſs of the horizontal
Parallax above 53′ —— —— 423

The Sum —— —— 2456 is the parallactic Logarithm of the Correction of Reduction — 2″, with the ſame Sign — as the Arc, and adding it to the
Reduction — 23

The Sum —— — 25 is the Correction of Diſtance.
obſerved Diſtance 35° 29′ 45″

35 29 20 true Diſtance cleared of Refraction and Parallax.

In the firſt Example the Variation is 3″. Suppoſe at the Time the Obſervation was made, the Barometer was 29 Inches high, and the Thermometer 75°. Say, if $1\frac{1}{2}$ Inch gives 3″, what does 1 Inch give? the Anſwer is 2″; which muſt have the Sign — before it, becauſe the Altitude of the Barometer is leſs than the Mean. Again, the Thermometer being 20° higher than 55°, there will be a Variation on that Account of 3″, which will likewiſe be Negative, becauſe the Thermometer is higher than the mean Altitude; therefore from the Correction of Diſtance + 6′ 39″, we muſt Subtract 5″ to find the true Correction anſwering to this State of the Atmoſphere, which will be + 6′ 34″. When the Barometer is higher than 30 Inches; and the Thermometer lower than 55°, the Variation is +, otherwiſe —.

To ſave the Trouble of making the Proportion for odd Minutes, the Table of proportional Parts is contrived; looking for the Change in the Reduction or the correcting Logarithm for 1° at the Top, and even with the odd Minutes found on the Side, will be the proportional Part: If the Change conſiſts of 2 or 3 Figures, the proportional Part muſt be found for each Figure. Thus in Example I, the Change for 1° of the Star's Altitude is 1′ 33″, or 93″, even with 27′ and under 90, I find 41″, and under 3, I find 1″; the Change therefore for 27′ is 42″.

Again; Suppoſe the Change in the correcting Logarithm for 1° of the Moon's Altitude was 639, what is the Change for 20′? Even with 20, and under 600, I find 200; under 30, 10; and under 9, 3; therefore the Change is 200 + 10 + 3, or 213.

A Table of proportional Parts.

TABLES

FOR CORRECTING THE
APPARENT DISTANCE
OF THE
MOON AND A STAR
FROM THE EFFECTS OF
REFRACTION AND PARALLAX.

Apparent Diſtance of the Moon and Star 10 Degrees.
